

Technical documentation

The purpose of this document is generic Technical document for the use of Task Management web application.

The Application features:

- view the list of existing tasks separated in categories.
- view each task details.
- edit task details: name, description, priority, category and dueDate.
- view list of subtasks of a task.
- edit subtask's name and check/uncheck.

Frameworks:

In order to build the single web application Angular framework has been used, which is JavaScript-based open-source front-end web application framework.

Bootstrap also has been used, which is the most popular HTML, CSS, and JavaScript framework for developing responsive, mobile-first websites.

Data Structure:

The data comes from an existing API in format of json object which contains arrays like: tasks, subtasks , category and users. Using some services and requests to GET and PATCH from and to the server.

Project Structure:

The Model View Controller (MVC) software design pattern has been implemented for the project structure.

A Model View Controller pattern is made up of the following three parts:

- Model – It is the lowest level of the pattern responsible for maintaining data.
- View – It is responsible for displaying all or a portion of the data to the user.
- Controller – It is a software Code that controls the interactions between the Model and View.

The model part in our project exists in the services which get and post data for the server which can be found under this directory: `./public/services/taskManagerServices.js`. One example of getting data :

```
app.service('getOneTask',['$resource','baseURL',function($resource,baseURL){
  this.getFeedback=function(id){
    return $resource(baseURL+"tasks/"+id,null,{
      'update':{
        method:'GET'
      }
    });
  };
});
```

This service is getting one task by requesting get method from the baseURL which is in our case `http://localhost:3000//tasks/{taskId}`

The view part exists in the html files.

The controller part which contains the functions and the logic of the tasks manager can be found under this directory: `./public/tasksView/taskManagerController.js`.

User Interaction:

The application starts at the login page which contains two input fields for username and password which are hardcoded for the user which has id equal 1.

Then after clicking on the login button it will direct the user to the tasks view page.

The table below shows the tasks separated by category type colored by green for example Personal, and you can expand and collapse the category to show tasks belong to it.

The tasks are sorted by their priority (high, medium, low) and you can filter each column by typing in the input field at each column's header.

Category ▲	Name	Description	Due Date	Priority ▲
+	No category (1)			
-	Personal (3)			
	Personal	Shopping		high
	Personal	Cooking		low
	Personal	Cleaning		medium
+	Work (1)			

Each row is a task and you can click on the task row to show task details and subtasks which you can also update tasks and subtasks as shown below:

Task Details

Name :

Cleaning

Description :

Priority :

medium

Due date :

mm/dd/yyyy

Category :

Personal

Update Task

Sub Task Details

Name	Done	Optional
Dust furniture and shelf	<input checked="" type="checkbox"/>	<input type="checkbox"/>
Mop	<input checked="" type="checkbox"/>	<input type="checkbox"/>
Vacuum	<input type="checkbox"/>	<input type="checkbox"/>
Clean carpets	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Change bed linens	<input type="checkbox"/>	<input type="checkbox"/>
Laundry	<input type="checkbox"/>	<input type="checkbox"/>
Dispose Garbage	<input type="checkbox"/>	<input type="checkbox"/>

Update sub Task
